Module Description
This module is about preparing testing documentation with focus on Test Case Specification (TCS), a component of the overall testing documentation required by an ITS project specification. Previous modules have discussed How to Write a Test Plan (T201) and provided an Overview of Test Design Specifications, Test Cases, and Test Procedures (T202). This module will extend this discussion by providing participants with an in-depth overview of the general structure and parts of test case specifications (TCS). All modules are available at the PCB website (Ref 6). Students are advised to take module T202 to prepare for this module.

The module has two parts: The first part covers the general structure of the testing documentation and parts of a TCS with representative examples, how test cases fit into the testing process and their relationship to the test plan, test design specification, and test procedures (as defined in IEEE 829). This module will also show students how to develop test cases to verify requirements for standards that have been through the SEP (ESS) and contain test documentation, and those that do not have SEP (ASC). The second part covers how to develop a test case specification for specific project requirements, how to develop requirements to test case matrix, and how to handle errors and failures. Subsequent modules will define how to prepare test procedures and how to perform tests.

This student supplement covers both parts of the module on Test Case Development.

1. Introduction
Prior to deployment, all equipment and system interface that must conform to ITS standards should be tested according to well-defined test documentation that includes a test plan and complete definition of the test design, test cases, and test procedures. The subject of this module is Test Case, which identifies a particular requirement to be tested and shows how to include it in the TCS document. For example, an agency needs to monitor a DMS sign in the field and has set a requirement for that; a Test Case will ensure this by listing this requirement and specify how to test it in a real environment so that system interface can be verified. Specific benefits are listed below.

Benefits specific to test cases include:

- Provides a benchmark of quality and reliability of data shared between systems;
- Systematic approach to testing messages shared between systems;
- Provides documented feedback to developers to focus their efforts in correcting data content and structure problems discovered during testing; and
- Consistent interpretation of standards, including consistent handling of errata, conflicting requirements, missing information, and extensions to handle local requirements.
2. Acronyms and Test Documentation Terminology

**Test Process:** Consider testing as an activity that is carried out with a series of steps in a life cycle of an ITS project. To ensure that the system interface delivers what the users have specified, a testing process is necessary to ensure outcomes. Such requirements are “communicated” in the testing documentation, beginning with a Test Plan (TCS is a component of the Test Plan). The purpose of software and software-based systems testing is:

- To help **build quality** into the software and system during the life cycle processes and to validate that the quality was achieved
- To determine whether the products of a given life cycle activity conform to the requirements of that activity, and whether the product satisfies its intended use and user needs
- Includes inspection, demonstration, analysis, and testing of software and software-based system products
- To perform test activities in parallel with development efforts, not just at the conclusion of the development effort

**Test Plan:** A test plan provides a description of the overall approach to testing all of the requirements to be verified. The Test Plan outlines the scope, approach, resources, and schedule of testing activities. Breakdown of Key Point: This first key point describes a test plan – the master document that will include the test cases. Explaining this key point shows the hierarchical structure (test plan – test design specification – test case) that is required to develop a fully system-engineered test plan.

**Test Design Specification (TDS):** A test design breaks apart testing into smaller efforts and describes a test design specification – the specification that outlines the requirements to be tested and which test cases cover which requirements. Explaining this key point shows the hierarchical structure (test plan – test design specification – test case) that is required to develop a fully system-engineered test plan.
**Test Case Specification (TCS):** A test case identifies and specifies the inputs, outcomes, and conditions for execution of a test and included in a document called Test Case Specification (TCS) as part of an ITS project overall Test Plan. A test case specifies the inputs, outcomes, and conditions for execution of a test. It identifies a specific input and/or output that needs to be tested, and records the purpose of the test, a description of the test, the input and output test specification, the environmental needs, references the test procedure, and describes the results of the test.

The suggested outline for a TCS is shown below:

- Test Case Identifier
- Objective
- Inputs
- Outcomes
- Environmental Needs
- Special Procedural Requirements
- Intercase Dependencies

**What does a Test Case verify?**

- To verify the requirements related to information exchanged between two systems by:
  - Verifying the **sequence** of information exchanged is correct:
    - Standards use **dialogs** to define information exchange sequence
  - Verifying the **structure** of information exchanged is correct
    - Standards define the **order** of Messages-Data Frames-Data Elements
  - Verifying the **content** of information exchanged is correct
    - Standards define the **valid value rules** (e.g., value ranges) for data exchanged

**Data Structure:** What is being tested as per a defined Test Case centers around key parts of a dialog, the data structure-content, values and sequence, which affects:

- Messages (Root level)
  - Root element in the hierarchy of data exchanged between centers
  - A Message is made up of Data Frames and Data Elements
- Data Frames (Branch level)
  - Reusable bundles of Data Elements and other Data Frames
- Data Elements (Leaf level)
  - Leaves in the hierarchy of data structure
  - Provide value constraints for data content
Example of a Test Case:
The following ESS example shows content of a test case.

<table>

Test Procedure Specification (TPS): Defines the steps to execute a test. Multiple Test Cases may reference a single Test Procedure.

IEEE Std 829 Documentation Structure: Figure 1 lists the prescribed structure by the IEEE approach to preparing testing documentation.
Test Reports: Generally, test reporting is covered by four document types: a) A test item transmittal report identifies the test items being transmitted for testing in the event that separate development and test groups are involved or in the event that a formal beginning of test execution is desired. b) A test log is used by the test team to record what occurred during test execution. c) A test incident report describes any event that occurs during the test execution which requires further investigation. d) A test summary report summarizes the testing activities associated with the execution of test plan specifications” [IEEE Std 829, p. iii]. The test summary report can summarize key results captured in the test logs and test incident reports.

Requirements: A requirement is a condition or capability needed by a user to solve a problem or achieve an objective [IEEE Std 1233, p. 3]. Definition of requirements for system software is one of the key activities of the systems engineering process. A set of requirements to describe the entire scope of the project shall be developed to precisely define what functions the software will perform, how well it must perform, and under what conditions this performance takes place. This portion of the development process identifies the system interface requirements that satisfy the expressed user needs.

RTM (Requirements Traceability Matrix): RTM is a project-specific (tailored) table that links each requirement to its standard design elements. Every project must have a RTM based on SEP style format such as one offered in C2F-ESS or DMS standards and NRTM in C2C-TMDD standard. RTM is the basis on which a system interface will be designed-built; therefore TCS refers to RTM for inputs/outputs.
NRTM (Needs to Requirements Traceability): for a C2C project, TMDD provides a NRTM which is tailored to a project. NRTM links user needs and requirements to prescribed data structures. TCS derives its inputs/outputs and dialogs from NRTM for a C2C testing.

PRL (Protocol Requirements List): A project-level table that traces a requirement to a user need for all NTCIP devices. SEP standards such as ESS and DMS do have PRL, however, CCTV and RMC do not and user must develop one for a project.

RTCTT (Requirements to Test Case Traceability Table): It will be used to verify that the software being implemented fulfills all of the system interface requirements. The following example shows details of a C2C project.

<table>
<thead>
<tr>

</tbody>
</table>

NTCIP Device standards with PRL, RTM and Test Plan: The following SEP-based NTCIP standards will help students to understand testing plan and related components (Ref.4). C2C standard TMDD provides NRTM for use in a test case (Ref.5).

3. Process to Develop a Test Case

This module introduces a process for developing a test case.

1. **Identify User Needs.** In this step, the test case developer uses the NRTM or PRL, if one is available in the standard. The NRTM or PRL can be used to document project-relevant User Needs. If there is no NRTM or PRL in the standard, such as for the NTCIP 1205 CCTV standard, then the project’s system engineer or test engineer will need to develop user needs for the project, and provide a trace to related requirements that fulfill the user needs. The course A317a: Understanding User Needs for CCTV Systems Based on NTCIP 1205
2. **Identify Requirements.** In this step, the test case developer uses the NRTM or PRL (or similar) to identify mandatory requirements (based on the user needs from step 1), and those requirements that are optional for the standard, but mandatory for the project, plus any other requirements (optional, performance, etc.).

3. **Identify Design Content: Dialogs, Inputs, Outputs.** The test engineer uses the RTM to trace from requirements to design, identifying relevant dialogs, inputs, and outputs. At this point the test engineer should have a list of data concepts (whether NTCIP objects or TMDD data elements, list of valid structure for the data, and valid dialogs (i.e., valid information exchange sequences). Center-to-field communications relies on a sequence of GET and SET operations, while center-to-center information exchanges are based on exchange of messages. At this point the test engineer may be able to fill in a portion of the test case: Identifier, Objective

4. **Document Value Constraints of Inputs/Outputs.** In this step, the test engineer reads object and data element specifications to identify value type (INTEGER, TEXT STRING, ENUMERATED LIST), and value ranges. For NTCIP standards, this information is contained in the object definitions and encoded in the ASN.1 format. For center-to-center standards, such as the TMDD, the value constraints are contained in the data element definitions and encoded in both ASN.1 and XML formats. The valid value rules of data content are documented in either an input specification or output specification. Both input and output specifications follow the same format. The format used in the course is a carry-over from the previous version of IEEE Std 829-1998.

5. **Develop Test Case.** As a final step, the test engineer completes the test case. The test case identifier and objective may have been entered early on (see step 3). The Inputs and Outcomes can be filled in, and reference the Input and Output Specifications, if applicable. Lastly, depending on test case-specific needs, the test engineer may fill in the environmental needs, special procedural requirements, and intercase dependencies.

### 4. Example Test Cases

Three case studies were developed in Part 2 using the steps described above. Due to the limited amount of information that can be shown in presentation format, this supplement contains all the information gathered by the author to develop the case studies.

### 4.1.5. Develop Test Case

<table>
<thead>
<tr>
<th>Test Case</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ID:</strong> TC001</td>
<td><strong>Title:</strong> Request Status Condition within the Device Dialog Verification (Positive Test Case)</td>
</tr>
</tbody>
</table>
| **Objective:** | To verify system interface implements (positive test case) requirements for a sequence of OBJECT requests for:  
  - 3.7.5 alarmTemperatureCurrentValue  
  - 3.7.6 alarmPressureHighLowThreshold  
  - 3.7.7 alarmPressureCurrentValue  
  - 3.7.8 alarmWasherFluidHighLowThreshold  
  - 3.7.9 alarmWasherCurrentValue  
  - 3.11 cctv label Objects  
  
  The test case verifies that the data content of the OBJECTs requested are correct.  
  No data inputs are required. An output specification is provided showing valid value constraints per the NTCIP 1205 v01 object definitions. |
| **Inputs:** | No data inputs are required. |
| **Outcome(s):** | All data are returned and verified as correct per the OBJECT constraints of NTCIP 1205 v01. See Test Case Output Specification TCOS001 – Status Condition within the Device (Positive Test Case) |
| **Environmental Needs:** | No additional needs outside of those specified in the test procedure |
| **Tester/Reviewer:** | M.I. |
| **Special Procedural Requirements:** | None |
| **Intercase Dependencies:** | None |

DESCRIPTION "<Definition>Describes the weather and travel situation in
terms of wind from staffed stations only. Specific ranges for these
values are defined in the Glossary of Meteorology.<DescriptiveName>WindSensor.situation:code
<Valid Value Rule>
Range Meaning
  other not defined within this standard, see manufacturers documentation
  unknown Unknown conditions
  calm Calm
  lightBreeze Light breeze
  moderateBreeze Moderate breeze
  strongBreeze Strong breeze
  gale Gale
  moderateGale Moderate gale
  strongGale Strong gale
  stormWinds Storm winds
  hurricaneForceWinds Hurricane force winds
  gustyWinds defined by a peak and a lull of greater than 46.3 tenths of
  meters per second within a 2 minute period.
<Data Concept Type>Data Element"
 ::= { windSensorEntry 10 }
### 4.2.4. Document Value Constraints for Inputs and Outputs

4.3.5. Develop Test Case

| Test Case | 
|-----------------|-----------------|
| **ID:** TC001 | **Title:** Link Status Request-Response Dialog Verification (Positive Test Case) |
| **Objective:** To verify system interface implements (positive test case) requirements for:  
1) Link Status Request-Response Dialog message exchange  
2) Contents of the Link Status Request Message  
3) Contents of the Link Status Information Message  
The test case verifies that the dialog, request message content, and response message content are correct by sending a request message (verified to be correct) across the system interface, and verification that the response message is correct. Input and output specifications are provided to verify the request and response message are correct per the requirements for the request and response message. |
| **Inputs:** Use the input file linkStatusRequest_pos.xml.  
Set network-information-type to 4 or the text “link status.” |
| **Outcome(s):** All data are returned and verified as correct: correct sequence of message exchanges, structure of data, and valid value of data content. See Test Case Output Specification TCOS001 - LinkStatusInformation (Positive Test Case) |
| **Environmental Needs:** No additional needs outside of those specified in the test plan. |
| **Tester/Reviewer** M.I. |
| **Special Procedural Requirements:** None |
| **Intercase Dependencies:** None |

6. Study Questions

1. Which of the following IEEE Std 829-based component describes data inputs and outputs to be tested?
   a) Test Plan
   b) Test Case Specification
   c) Test Design Specification
   d) Test Procedure Specification

2. Which of the following defines the structure and data content of inputs and outputs?
   a) Data Dictionary Standard (e.g., NTCIP 1204 ESS, TMDD)
   b) Protocol Requirements List (PRL)
   c) Requirements to Test Case Traceability Matrix (RTCTM)
   d) All of the above

3. Which of the following will provide information on project needs for a C2C project?
   a) Needs to Requirements Traceability Matrix (NRTM)
   b) Requirements to Test Case Traceability Matrix (RTCTM)
c) Requirements Traceability Matrix (RTM)

d) Design (dialogs, data elements, valid values)

4. **Which of the following is part of the IEEE Std 829 Test Case Specification?**

   a) Description and valid values of inputs and outputs
   b) Project Sponsor
   c) Steps to Conduct a Test
   d) Test Pass-Fail
