RITA Intelligent Transportation Systems
Joint Program Office

Welcome

- Shelley Row, P.E., PTOE
- Director
- ITS Joint Program Office
- Shelley.Row@dot.gov

WWW.PCB.ITS.DOT.GOV

The screenshot shows the RITA website header with the logo and navigation menu. The main content area is titled "ITS Professional Capacity Building Program" and includes sections for "Welcome to ITS Professional Capacity Building", "ITS Technical Assistance", "News", and "Scheduled T3 Webinars".

>Welcome to ITS Professional Capacity Building

The ITS Professional Capacity Building (PCB) Program provides comprehensive, accessible, and flexible ITS learning for the transportation industry. By using the program, public agencies can build and sustain a capable and technically proficient ITS workforce, and transportation professionals can develop their knowledge, skills, and abilities while furthering their career paths.

The plan, [ITS Professional Capacity Building: Setting Strategic Direction 2010-2014](#), describes the strategy the ITS PCB Program is pursuing to create a 21st century learning environment and build an ITS profession that leads the world in the innovative use of ITS technologies.

ITS Technical Assistance

The ITS PCB Program offers technical assistance resources to State and local transportation agencies, and to FHWA Field Offices.

- [ITS Peer-to-Peer Program](#) helps resolve ITS challenges by speaking to your peers.
- The ITS Help Line provides [technical support by e-mail](#) or telephone 866-367-7487.

Scheduled T3 Webinars

Register now for these upcoming T3 webinars:

Date	Time	Topic
June 23, 2011	1:00 PM – 2:30 PM ET	2011 Enhancements to the ITS Knowledge Resources Websites: Improving Access to Information on ITS Benefits, Costs, Lessons Learned and Deployment
June 29, 2011	1:00 PM – 2:30 PM ET	Open Payments, Mobile Payments and Personal Identification Verification (PIV) Acceptance – Overview of Innovations in Public Transit Payment Systems

T101: Introduction to ITS Standards Testing

Target Audience

- Engineering staff
- Operational staff
- Maintenance staff
- Decision makers (in feedback loop) in a procurement capacity (acquisitions department)

Instructor

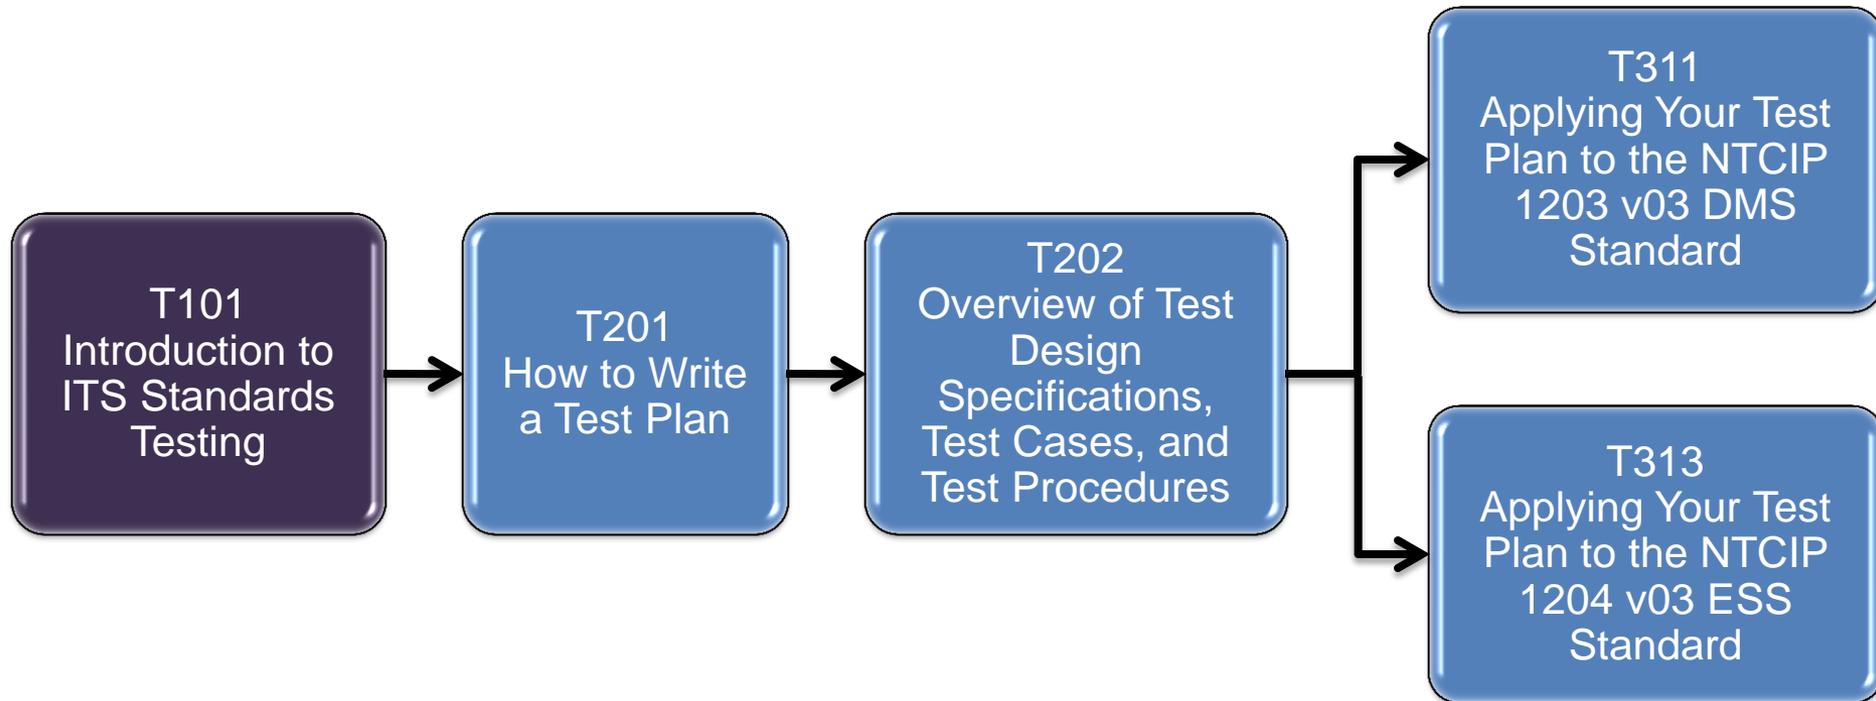

Gary B. Thomas, P.E., Ph.D.
Research Engineer
Texas Transportation Institute
College Station, TX, USA

Recommended Prerequisites

- A100
- A200
- A300 level courses as appropriate

Curriculum Path (Testing)

Learning Objectives

1. Explain the need for and benefits of testing
2. Describe how ITS standards testing fits into the overall scope of a systems test and a systems life cycle
3. Discuss how to test an implementation for conformance to standards
4. Distinguish the difference between standard conformance and project compliance

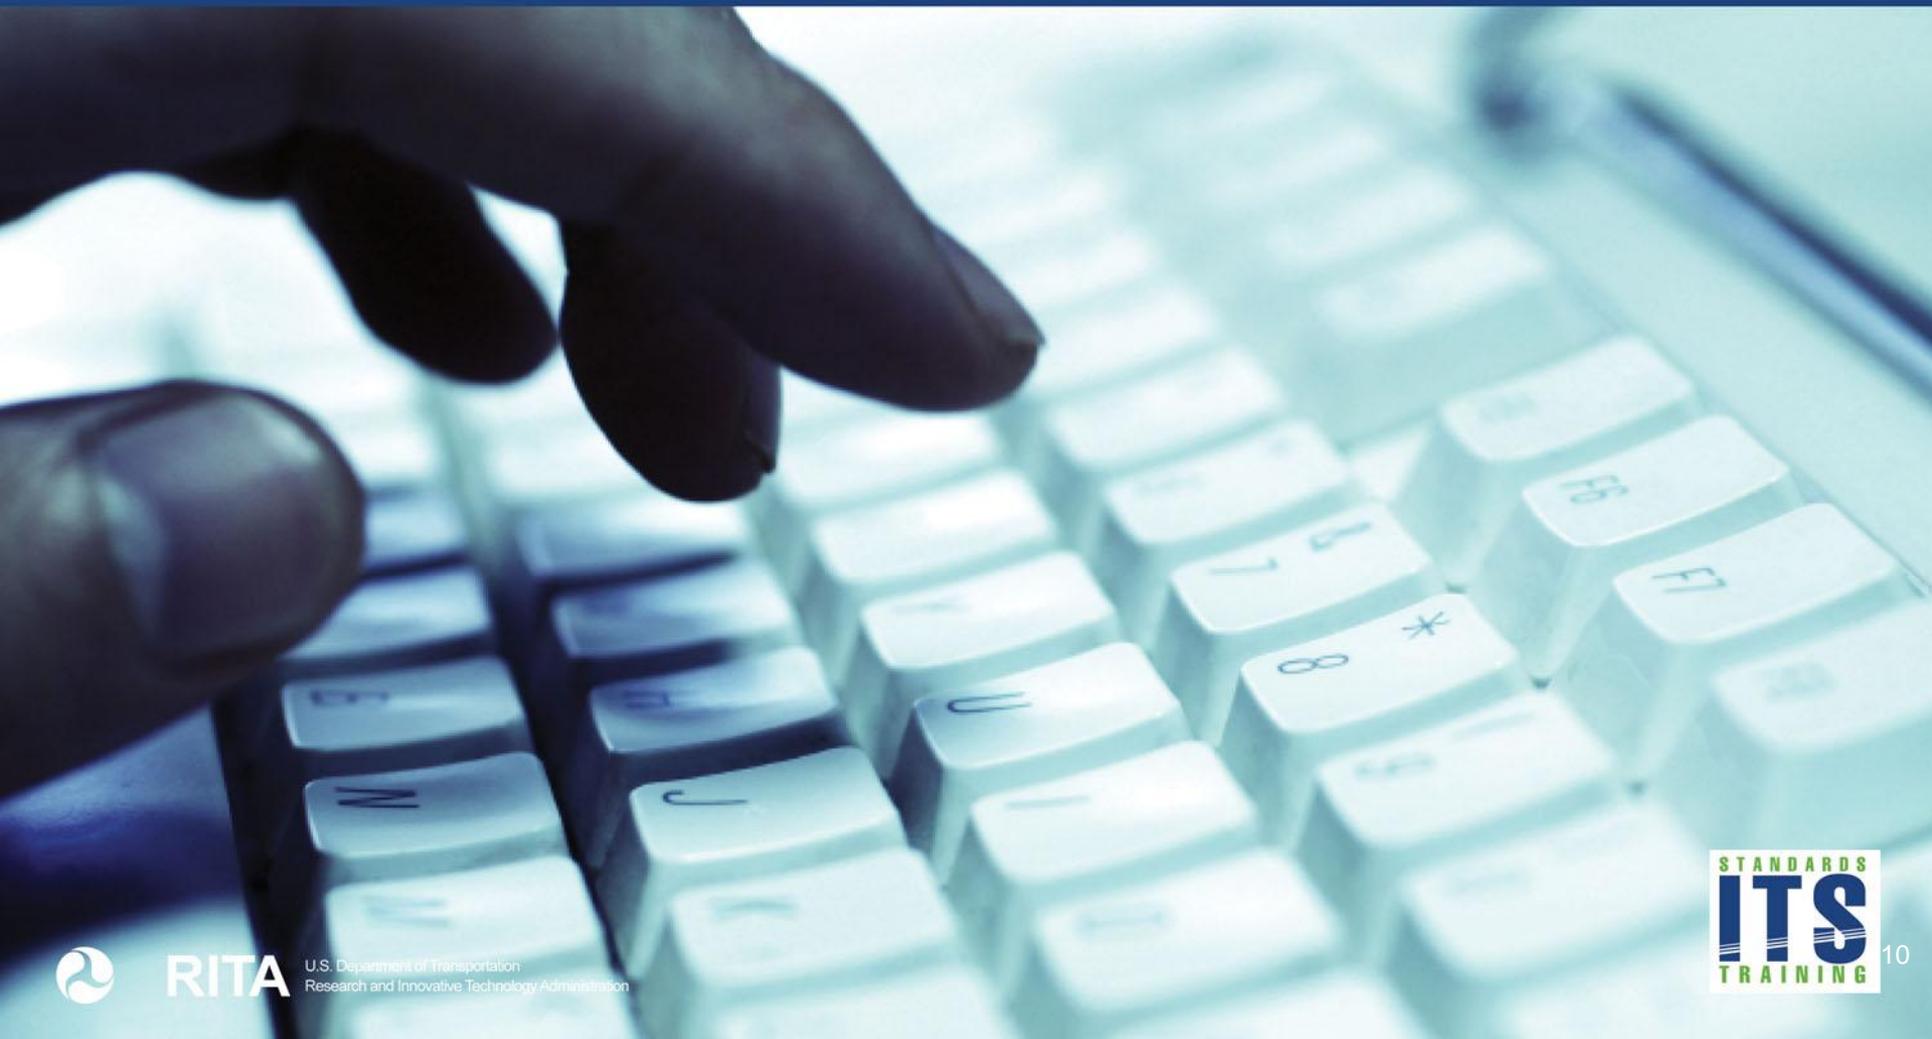

What is Testing?

Two types:

1. Standards testing
 - Provides information to users on the reliability, interoperability, functionality, and performance of systems using the standard
2. System's conformance to documented test plan based upon an ITS standard
 - The topic of this Webinar

ACTIVITY

RITA

U.S. Department of Transportation
Research and Innovative Technology Administration

Benefits of Testing

- What do you see as possible benefits of testing?
- Use the chat pod to answer

Benefits of Testing

- Verify that requirements are fulfilled
- Reduce the risk of misinterpretation between agency and manufacturers
- Reduce the risk of financial mismanagement
- Reduce the risk of perceived lack of oversight
- Ensure interoperability to allow system expansion

Who Does the Testing?

- Agency should identify party
- Typical testing parties:
 - Agency (includes agency's contractor)
 - Manufacturer
 - Independent laboratory
- All parties should have a clear understanding of their testing responsibilities
 - Clear description of the consequences of test failure(s)

Terminology

- **Conformance:** A condition that exists when an item meets all of the mandatory and selected optional requirements as defined by a standard.
- **Compliance:** A condition that exists when an item meets all of the requirements of an agency specification.

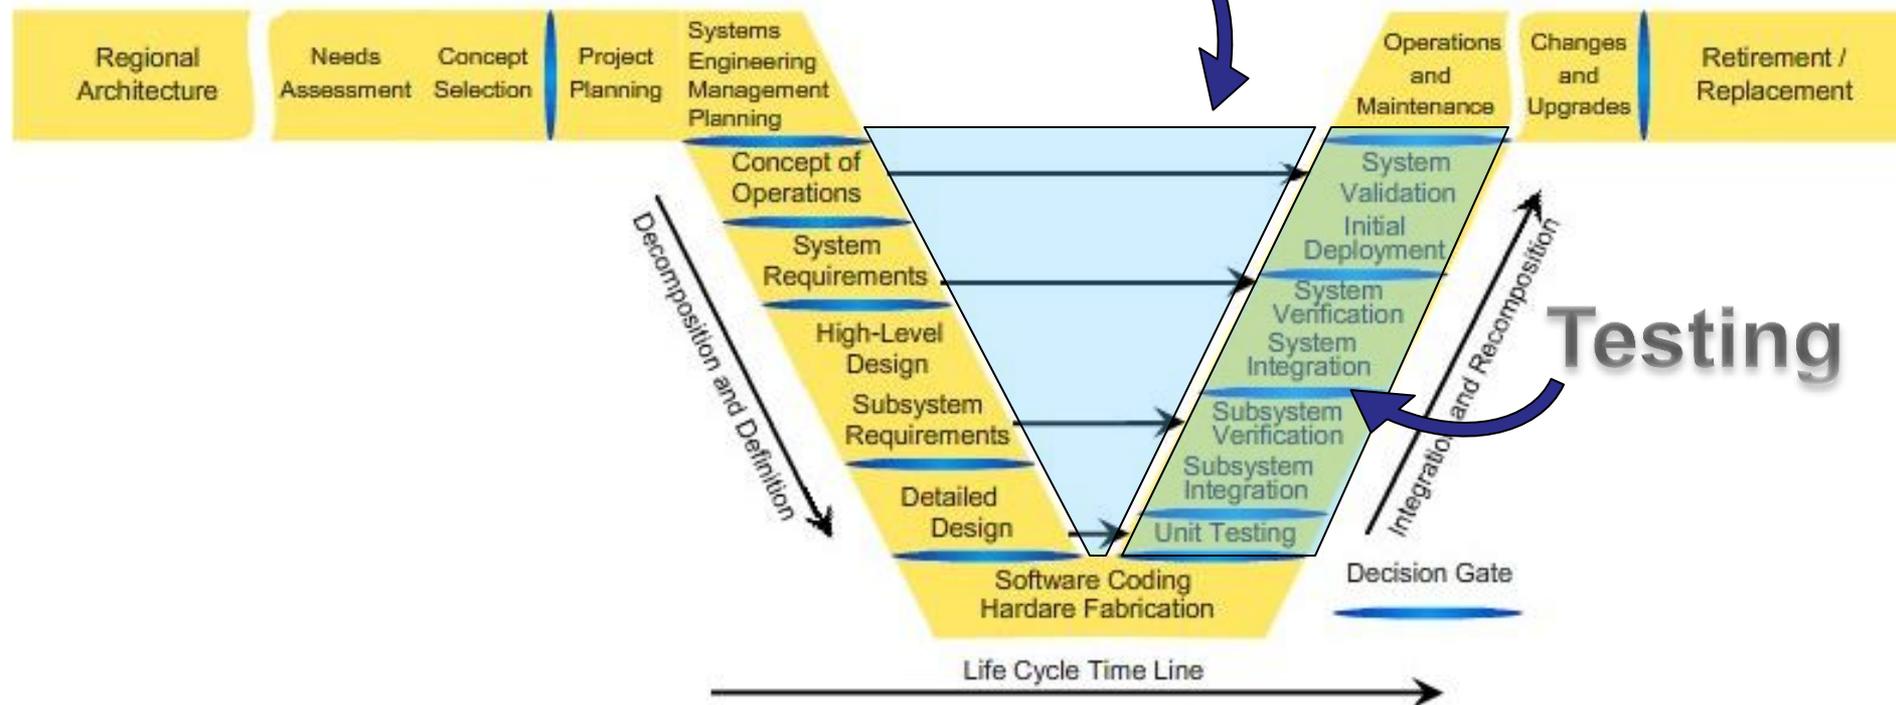

Terminology

- **Validation:** Making sure a system, when placed in operation, will support agency needs
 - In other words: Have we built the right thing?
- **Verification:** Making sure a design complies with requirements and that the systems (as proposed and delivered) comply with both design and requirements
 - In other words: Have we built the thing right?
- **Traceability:** A tool to help determine if the agency's requirements are fulfilled by the design and that implementation was done correctly

Testing and the Systems Engineering Process

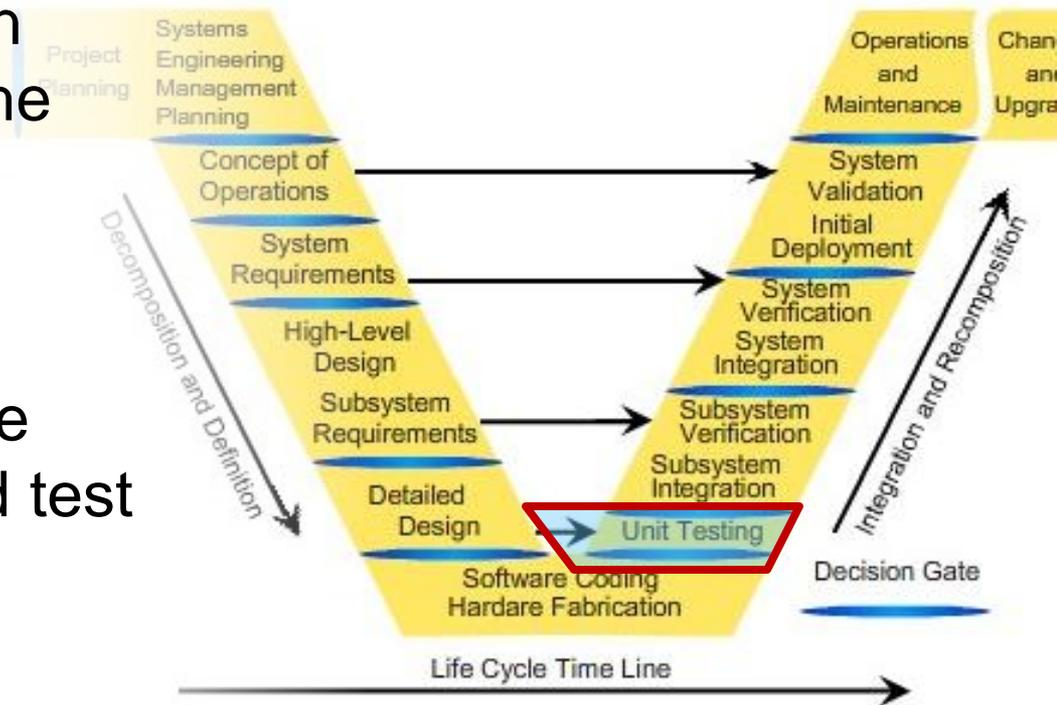

Traceability

Testing and the Systems Engineering Process

Unit/Device Testing

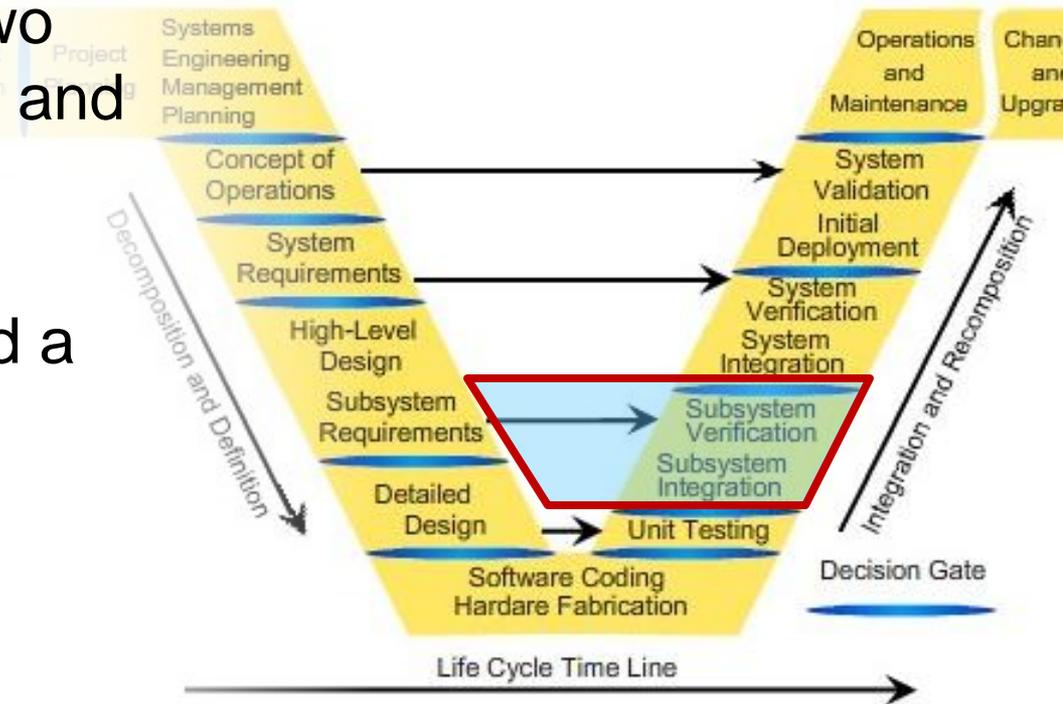

- Focuses on comparing an implementation against the standards and specified options
- May be performed by inspecting the code to use “proven” software to send test messages to the device.

Testing and the Systems Engineering Process

Subsystem Testing

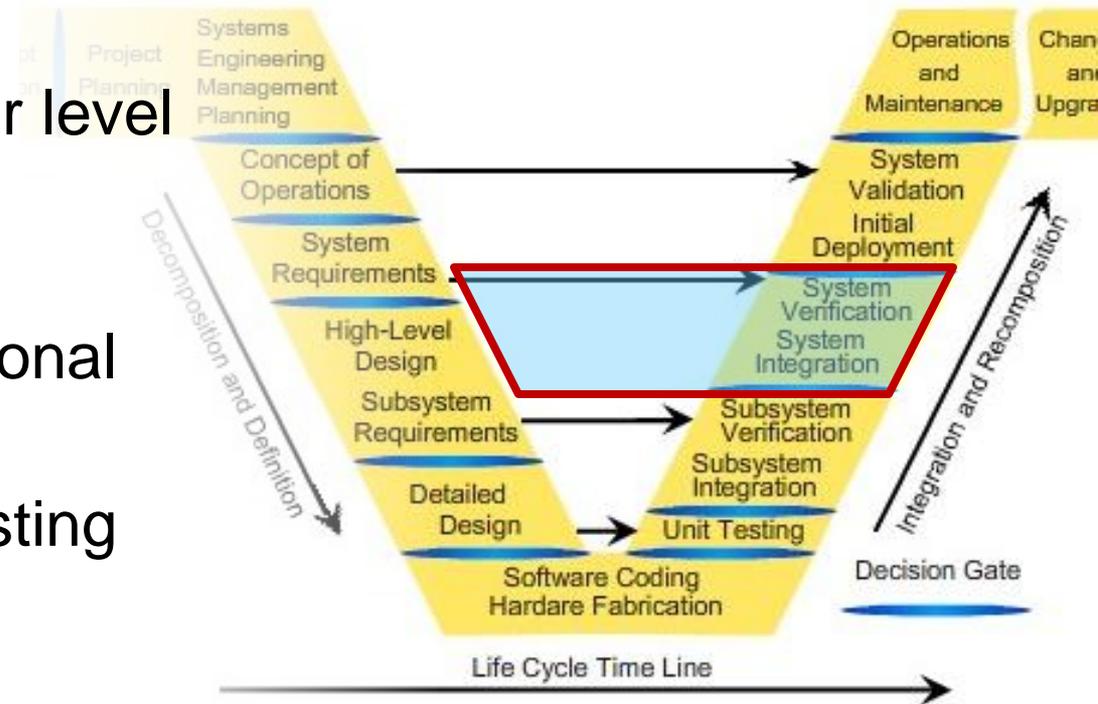

- Consists of connecting two or more devices together and exchanging data
- Assumes devices and components have passed a designed unit test plan
- Assumes devices or subsystem components support same ITS operational and/or functional features.

Testing and the Systems Engineering Process

System Testing

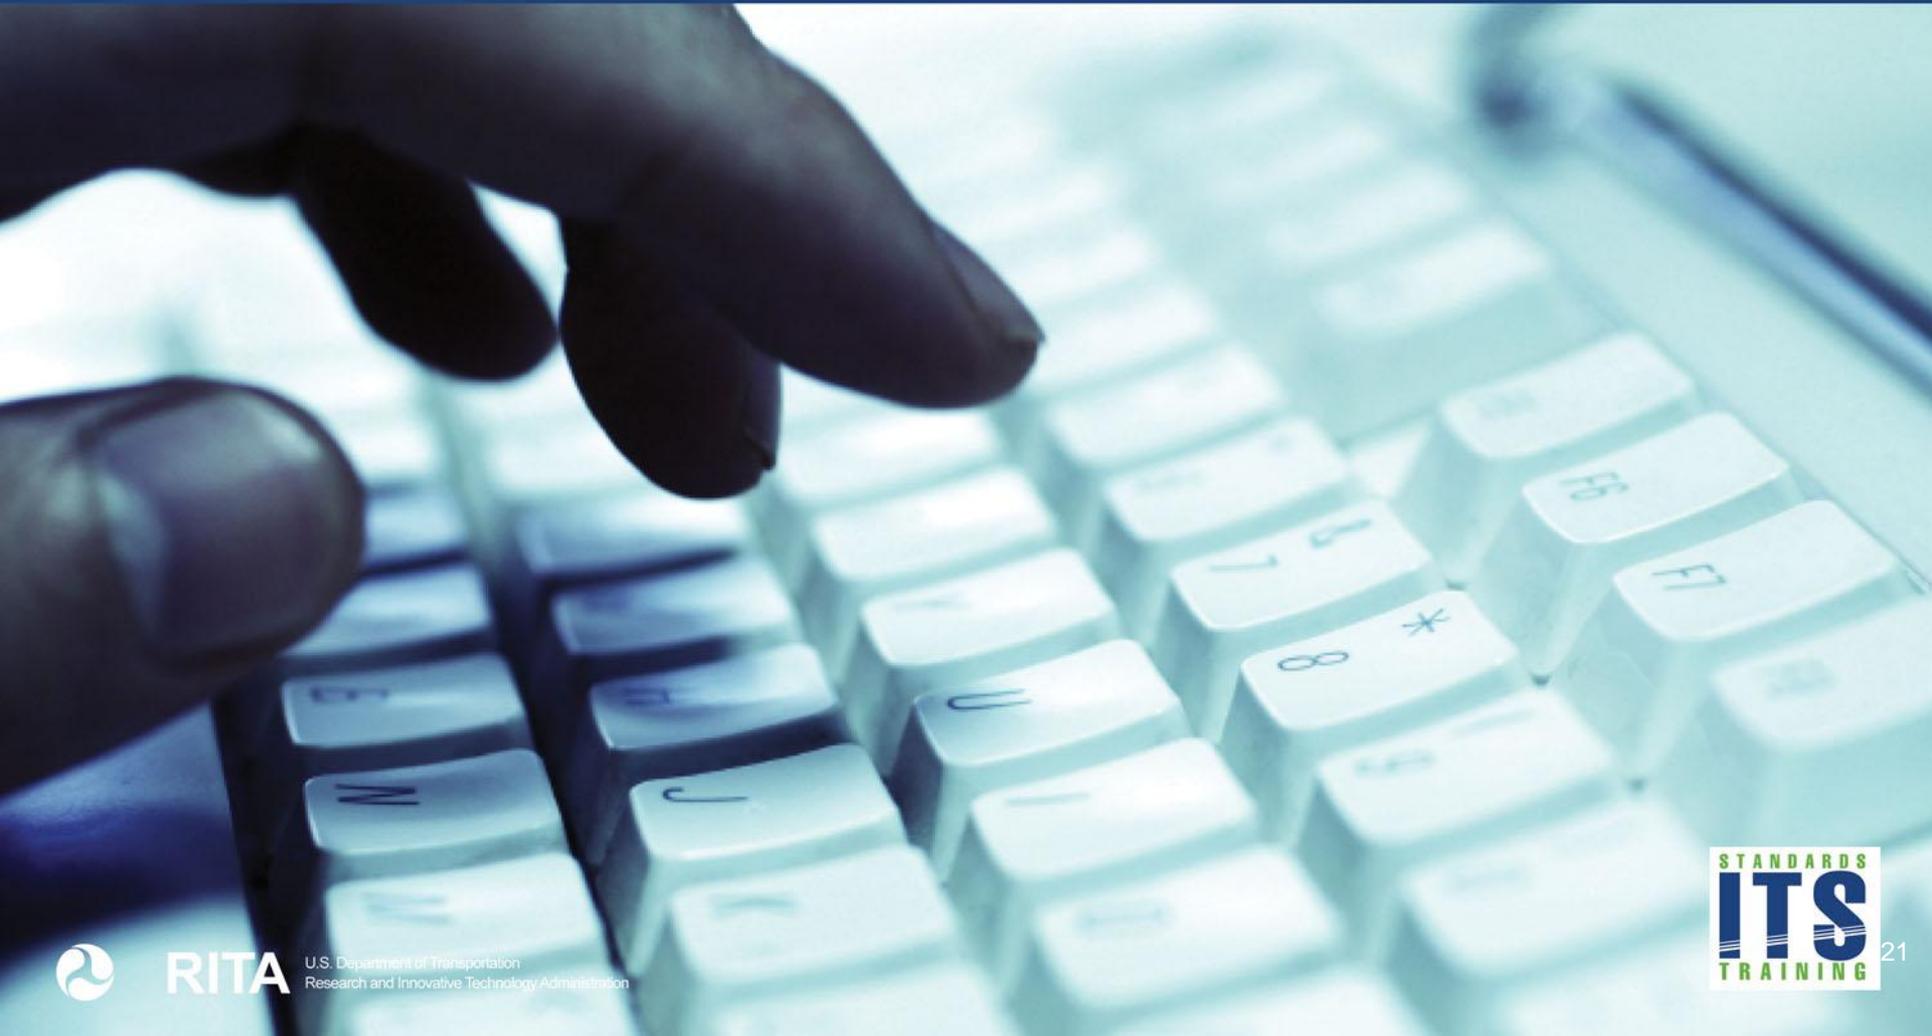

- Highest level of testing
- Performed after all lower level testing is successfully completed
- Performed in an operational environment
- Includes acceptance testing

IEEE 829

- Standard that specifies the form of a set of documents for use in eight defined stages of software testing
- Each stage may have its own document
 - Specifies the format of these documents
 - Does not stipulate whether they all must be produced
 - Does not include any criteria regarding adequate content for these documents
- Software testing standard applicable to other types of testing
- A framework for testing within the life cycle

Research and Innovative Technology Administration

What Should a Test Plan Cover?

- What do you think a test plan should cover?
- Use the chat pod to answer

Testing Considerations

- Maturity of device, software, interface, or system
- Number of units (if a device)
- Agency's ability to test
- Available expertise
- Significance of specification requirement

Test Plans

- Management planning document that covers the “who, what, when, and how”
- Defined in IEEE 829-1998
- Convey the scope, approach, resources, and schedule of testing activities
- Identifies:
 - Items and features to be tested
 - Tasks to be performed
 - Personnel responsible
 - Associated risks
- A well-designed test plan feeds into the more detailed test procedures

Test Plan Benefits

- Provides framework and process to verify that the system meets user needs
- Improve stakeholder participation
- More adaptable, resilient systems
- Verify functionality and fewer defects
- Higher level of reuse from one project to the next
- Better documentation

Test Procedures

- Details regarding how to run each test
- Includes set-up preconditions and steps to be followed
- Allows for flexibility
- Format for test procedures
 - Included in NTCIP 8007 v.01
 - Should reference agency specification requirements

Systems Engineering Testing Phases

- Prototype test and inspection
- Design approval test and inspection
- Factory acceptance test
- Incoming device test
- Site acceptance test
- Burn-in and observation test

Systems Engineering Testing Phases

Prototype Test and Inspection

- Purpose: Verify the electrical and mechanical design
- Number of units: One prototype
- Test Location: Test laboratory

Design Approval Test and Inspection

- Purpose: Verify the final design
- Number of units: Pre-production or small percentage of units
- Test Location: Laboratory

Systems Engineering Testing Phases

Factory Acceptance Test

- Purpose: Verify production units are identical to final design and production quality
- Number of units: Percentage of production units
- Test Location: Production factory

Incoming Device Test

- Purpose: Inspect for damage due to shipping/handling
- Number of units: All delivered units (including spares)
- Test Location: Agency
- Conformance testing begins

Systems Engineering Testing Phases

Site Acceptance Test

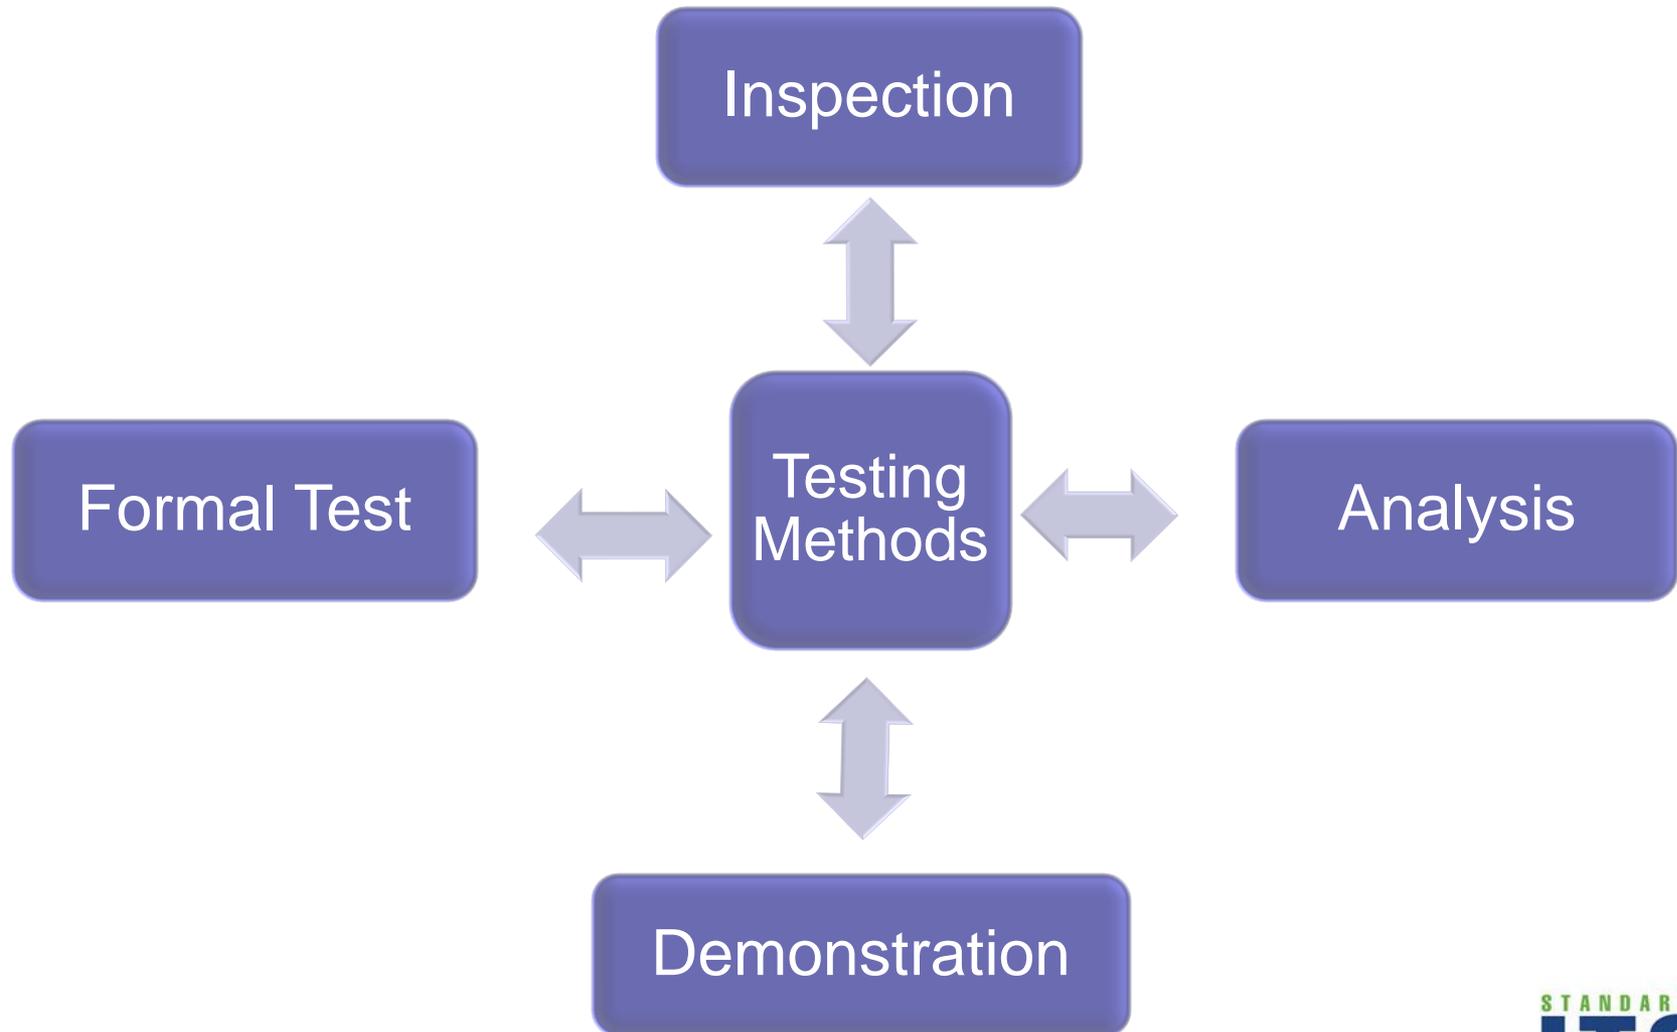

- Purpose: Full functionality of the entire system
- Number of units: All installed units
- Test Location: Final location for operation
- Conformance testing continues

Burn-in and Observation Test

- Purpose: Monitor proper operation of the installed unit
- Number of units: All installed units
- Test Location: Final location for operation

Methods of Testing

Methods of Testing

Inspection

- Verification by physical and visual examination
- Reviewing descriptive documentation
- Comparing appropriate characteristics
- Examples:
 - Measuring cabinets sizes
 - Matching paint color samples
 - Observing printed circuit boards

Methods of Testing

Analysis

- Verification by evaluation or simulation using mathematical means
- Can be used to extrapolate past performance for scaled up deployment
- Examples:
 - Internal temperature gradients for dynamic message sign
 - Review of power supply designs to verify temperature and voltage limitations

Methods of Testing

Demonstration

- Functional verification by observing an operation or exercise performed under specific condition
- Examples:
 - Accuracy of displays
 - Comparison of system outputs with test cases
 - System recovery from induced failures

Methods of Testing

Formal testing

- Verification that requirement is met by testing under controlled exercises using real or simulated stimulus
- Examples:
 - System performance
 - System functionality
 - Data distribution

Conformance

- Exists when an item fulfills all mandatory requirements defined by a standard and any selected optional portions of the standard
- Conformance testing is designed to verify that the device fulfills the mandatory and optional requirements of the applicable standard(s)
- Prior to testing, ensure that a set of well-defined requirements exists and can be verified
- Testing addresses all parts of the standards that are mandatory for the ITS device
- Conformance is tested against all mandatory and selected optional requirements of the standard

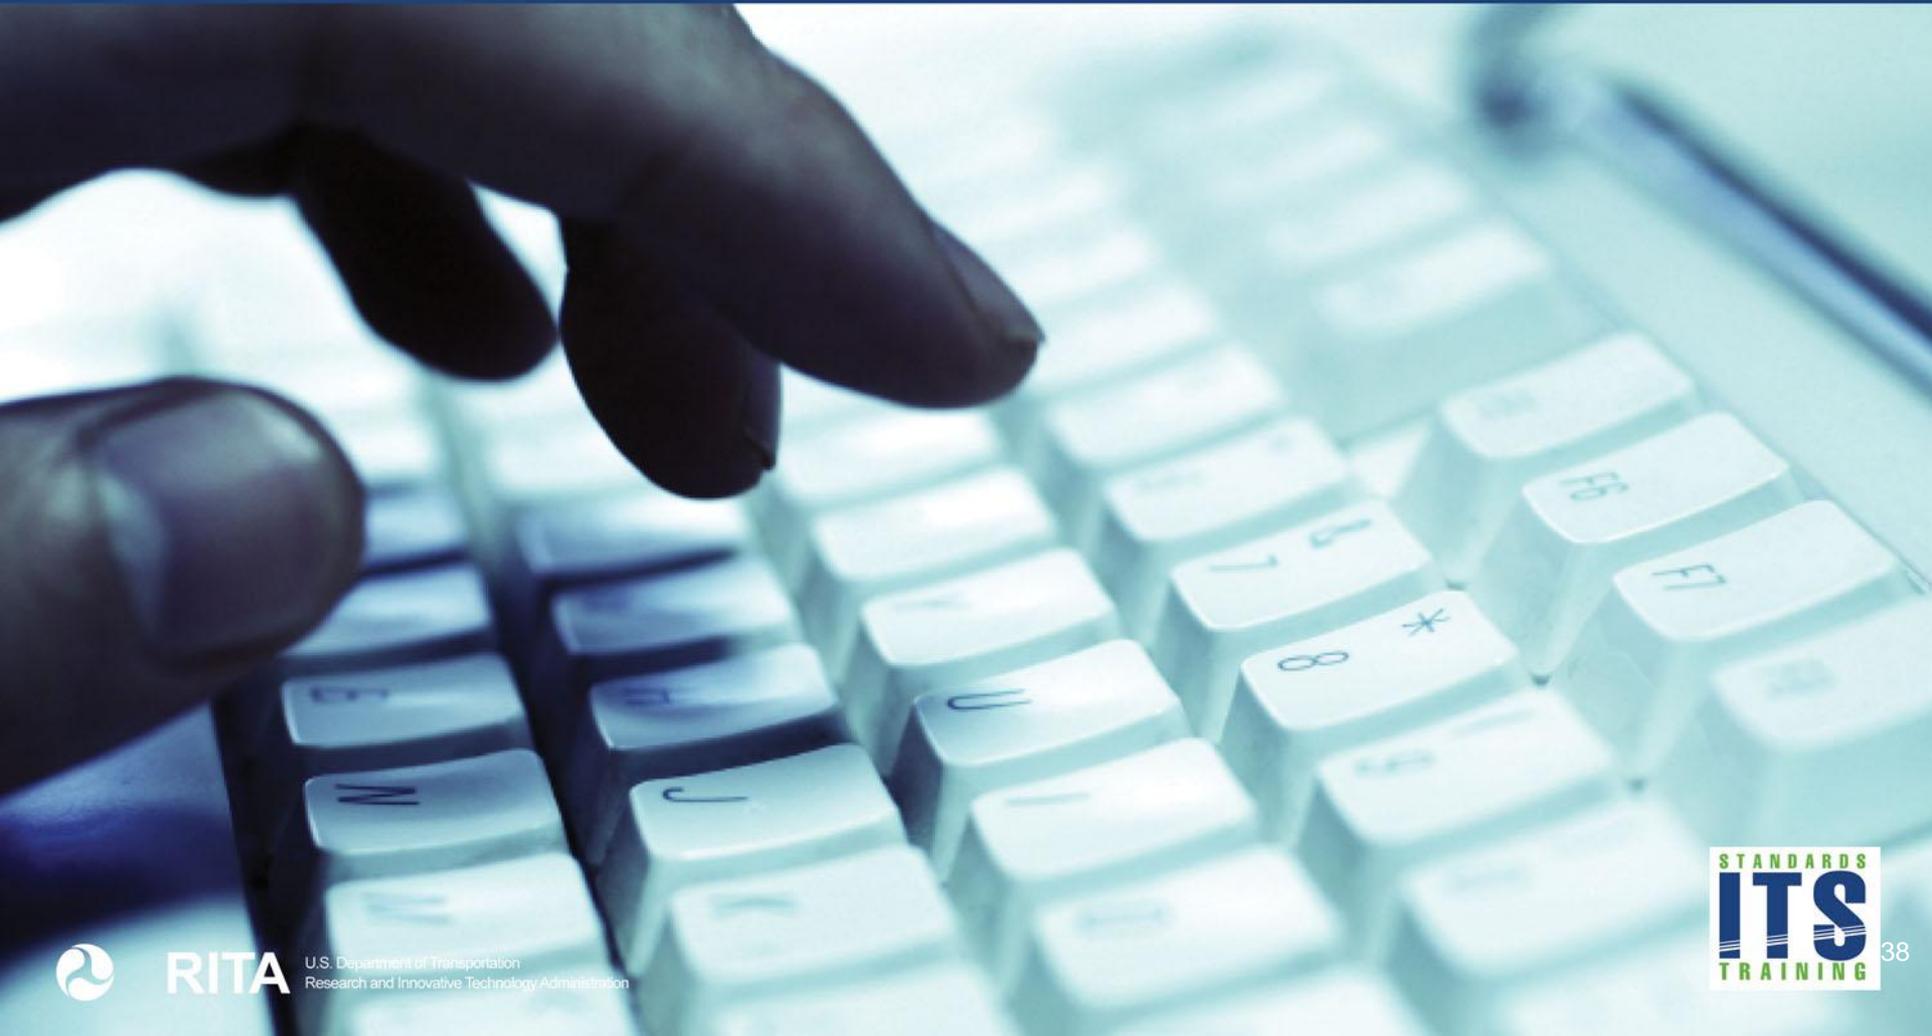

Compliance

- Exists when an item meets all requirements of an agency specification
- Compliance testing is designed to verify that the device fulfills the requirements of an agency's specification
- Creating a specification is necessary to ensure that all optional elements in the standard are required for your deployment
- Specifications also allow for the explicit removal of optional elements that do not apply
- Compliance is tested against the requirements developed as part of a project

Why is Conformance Necessary?

- Why do you think conformance is necessary?
- Use the chat pod to answer.

The Need for Conformance

- Helps to build the right system correctly
- Able to validate using standardized testing
- Interoperability is a chief benefit

Return on Investment

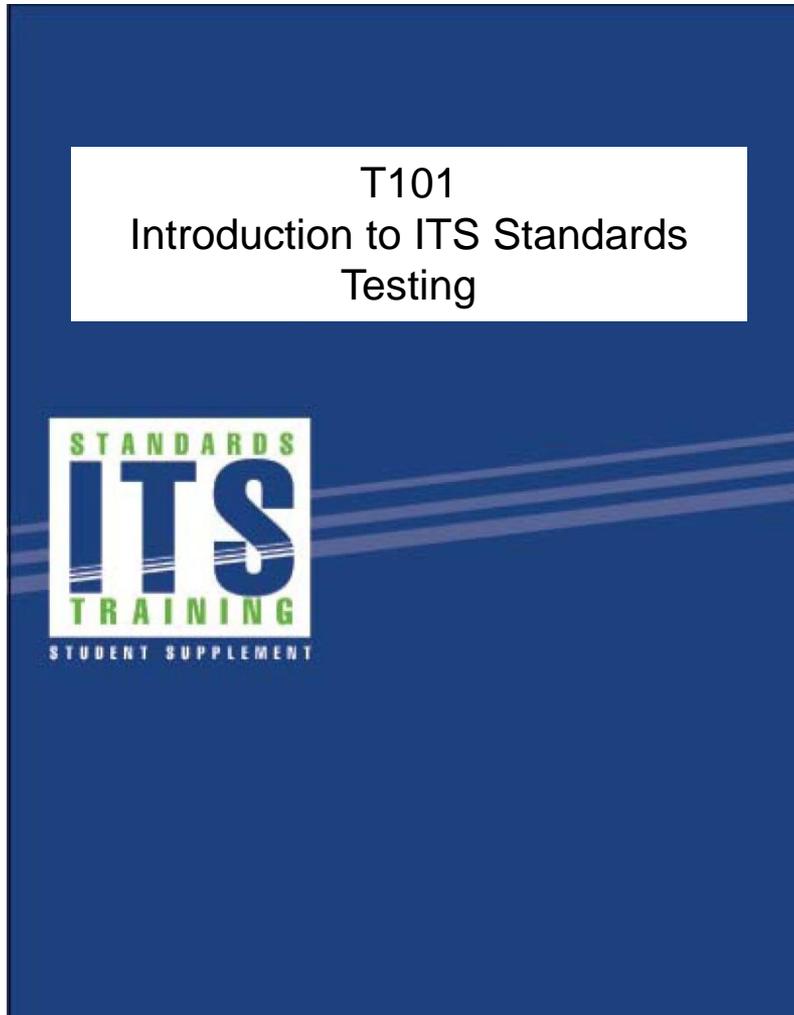

- Testing reduces risk
- Risk imposes a cost
 - $\text{risk} = \text{cost of remediation} \times \text{probability of worst case}$
- Cost of rejecting devices after installation include:
 - Replacement cost
 - Legal fees
 - Lost benefit during delay of implementing devices

Review of Learning Objectives

- ✓ Explain to decision makers the need for and benefits of standardized testing.
- ✓ Describe how ITS standards testing fits into the overall scope of a systems test and a systems life cycle.
- ✓ Discuss how to test an implementation for conformance to standards.
- ✓ Distinguish the difference between standard conformance and project compliance.
